## Motivating Example: The ENGAGE Study (McKay, et al., 2015)

- In treating alcohol- and cocaine-dependent patients, there is a question as to how best to re-engage individuals who do not engage in treatment.

## Motivating Example: The ENGAGE Study (McKay, et al., 2015)

- In treating alcohol- and cocaine-dependent patients, there is a question as to how best to re-engage individuals who do not engage in treatment.
- For these individuals, should we attempt to re-engage them in their original treatment, or offer them a choice of treatment modality?

## Motivating Example: The ENGAGE Study (McKay, et al., 2015)

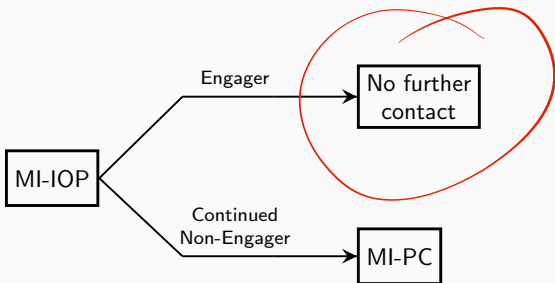

- In treating alcohol- and cocaine-dependent patients, there is a question as to how best to re-engage individuals who do not engage in treatment.
- For these individuals, should we attempt to re-engage them in their original treatment, or offer them a choice of treatment modality?
- What do we do if that doesn't work?

## Motivating Example: The ENGAGE Study (McKay, et al., 2015)

- In treating alcohol- and cocaine-dependent patients, there is a question as to how best to re-engage individuals who do not engage in treatment.
- For these individuals, should we attempt to re-engage them in their original treatment, or offer them a choice of treatment modality?
- What do we do if that doesn't work?
- This is a question about a *sequence* of treatments.

## Dynamic Treatment Regimens

**Dynamic treatment regimens** operationalize clinical decision-making by recommending particular treatments to certain subsets of patients at specific times. (Chakraborty and Moodie, 2013)

- **MI-IOP:** 2 motivational interviews to re-engage patient in intensive outpatient program
- **MI-PC:** 2 motivational interviews to engage patient in treatment of their

## Sequential, Multiple-Assignment Randomized Trials

A **SMART** is one type of randomized trial design that can be used to answer questions at multiple stages of the development of a high-quality DTR.

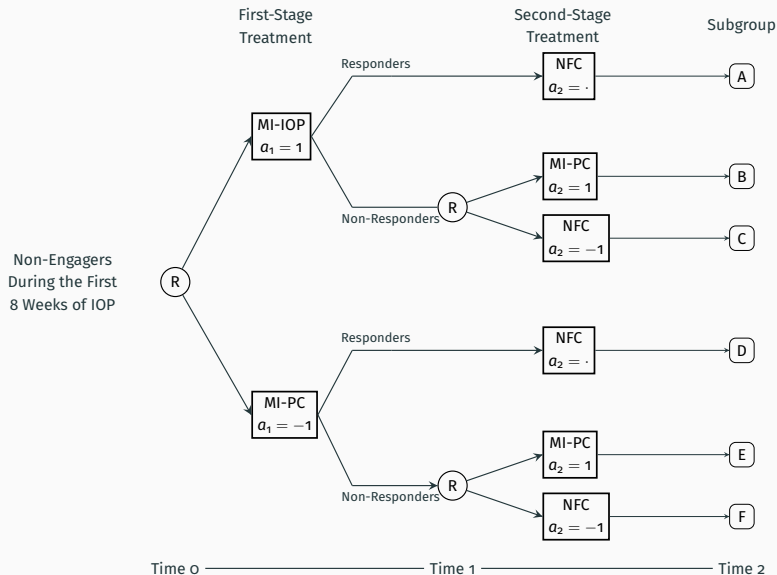

## Sequential, Multiple-Assignment Randomized Trials

A **SMART** is one type of randomized trial design that can be used to answer questions at multiple stages of the development of a high-quality DTR.

The key feature of a SMART is that some (or all) participants are randomized *more than once*.

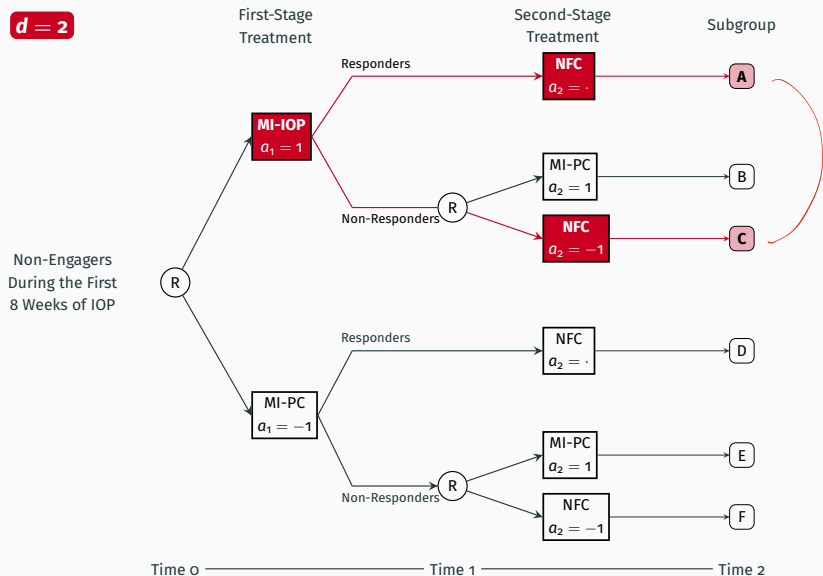

# Motivating Example: The ENGAGE Study (McKay, et al., 2015)

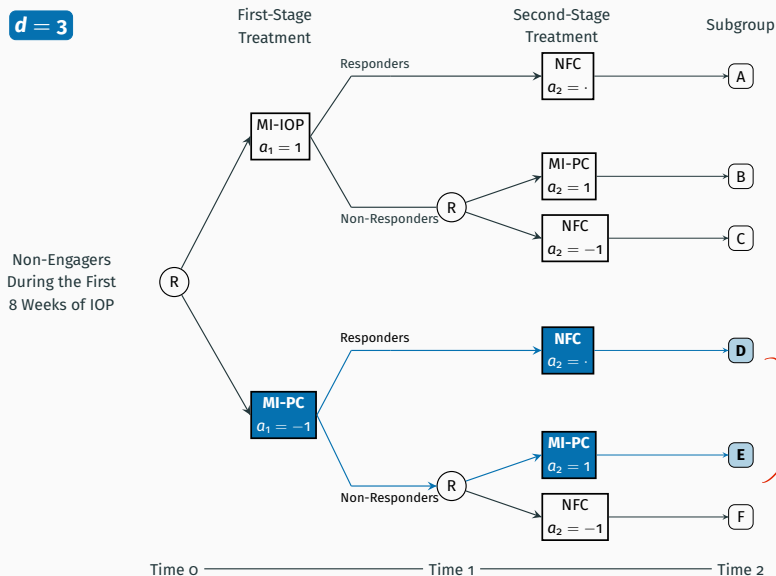

# Four Embedded DTRs

$d = 2$

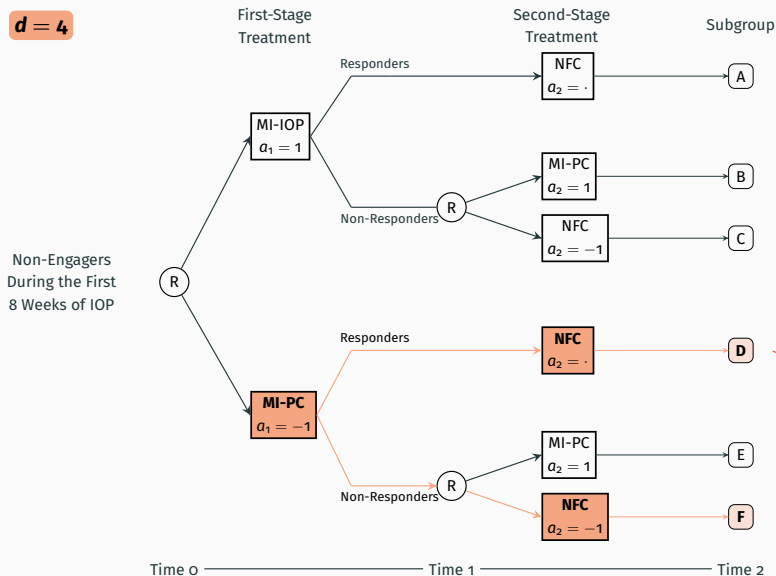

# Four Embedded DTRs

$d = 3$

# Four Embedded DTRs

$d = 4$

**A common primary aim in a SMART**

is the comparison of two embedded DTRs using a continuous outcome collected at the end of the study.

# Primary Aim

$d = 1$

$d = 3$

Non-Engagers  
During the First  
8 Weeks of IOP

# A Model for a Continuous Longitudinal Outcome in ENGAGE

(Lu, et al., 2016)

$$\begin{aligned}
 E_{(d)} [Y_t | \mathbf{X}] &:= \mu^{(d)}(\mathbf{X}_i; \boldsymbol{\eta}, \boldsymbol{\gamma}) \\
 &= \boldsymbol{\eta}^\top \mathbf{X}_i + \gamma_0 \\
 &\quad + \mathbb{1}_{\{t \leq 1\}} \{ \gamma_1 t + \gamma_2 \mathbf{a}_1 t \} \\
 &\quad + \mathbb{1}_{\{t > 1\}} \{ \gamma_1 + \gamma_2 \mathbf{a}_1 \\
 &\quad \quad + \gamma_3 (t - 1) + \gamma_4 (t - 1) \mathbf{a}_1 \\
 &\quad \quad + \gamma_5 (t - 1) \mathbf{a}_2 \\
 &\quad \quad + \gamma_6 (t - 1) \mathbf{a}_1 \mathbf{a}_2 \}
 \end{aligned}$$

	<b>d = 1</b>	<b>d = 2</b>	<b>d = 3</b>	<b>d = 4</b>
<b>a<sub>1</sub></b>	1	1	-1	-1
<b>a<sub>2</sub></b>	1	-1	1	-1

# “GEE-Type” Estimating Equations for Model Parameters

(Lu, et al., 2016)

$$\mathbf{0} = \sum_{i=1}^N \sum_d \left[ I^{(d)}(A_{1i}, R_i, A_{2i}) \cdot W(R_i) \cdot \mathbf{D}^{(d)}(\mathbf{X}_i)^\top \cdot \mathbf{V}^{(d)}(\boldsymbol{\alpha})^{-1} \cdot \left( \mathbf{Y}_i - \boldsymbol{\mu}^{(d)}(\mathbf{X}_i; \boldsymbol{\eta}, \boldsymbol{\gamma}) \right) \right],$$

where

- $d$  specifies an embedded DTR,
- $I^{(d)}(A_{1i}, R_i, A_{2i}) = \mathbb{1}_{\{A_{1i}=a_1\}} \left( R_i + (1 - R_i) \mathbb{1}_{\{A_{2i}=a_2\}} \right)$
- $W(R_i) = 2(R_i + 2(1 - R_i))$
- $\boldsymbol{\mu}^{(d)}(\mathbf{X}_i; \boldsymbol{\eta}, \boldsymbol{\gamma}) = E \left[ \mathbf{Y}^{(d)} \mid \mathbf{X}_i \right]$
- $\mathbf{D}^{(d)}(\mathbf{X}_i) = \frac{\partial}{\partial (\boldsymbol{\eta}^\top, \boldsymbol{\gamma}^\top)^\top} \boldsymbol{\mu}^{(d)}(\mathbf{X}_i; \boldsymbol{\eta}, \boldsymbol{\gamma})$
- $\mathbf{V}^{(d)}(\boldsymbol{\alpha})$  is a working model for  $\text{Var} \left( \mathbf{Y}^{(d)} - \boldsymbol{\mu}^{(d)}(\mathbf{X}_i; \boldsymbol{\eta}, \boldsymbol{\gamma}) \mid \mathbf{X}_i \right)$

**Goal:**

Develop a sample size formula for SMARTs with a continuous, repeated-measures outcome in which the primary aim is to compare two embedded DTRs at the end of the study.

## Sample Size for an End-of-Study Comparison

$$N \geq \frac{4 \left( z_{1-\alpha/2} + z_{1-\beta} \right)^2}{\delta^2} \cdot (1 - \rho^2) \cdot (2 - r)$$

where

- $\delta = E[Y_2^{(d)} - Y_2^{(d')}] / \sqrt{(\text{Var}(Y_2^{(d)}) + \text{Var}(Y_2^{(d')}))} / 2$
- $\alpha$  is the desired type-I error
- $1 - \beta$  is the desired power
- $\rho = \text{cor}(Y_t, Y_{t'})$  for  $t \neq t'$
- $r = P(R_i = 1)$

## Sample Size for an End-of-Study Comparison

$$N \geq \underbrace{\frac{4 \left( z_{1-\alpha/2} + z_{1-\beta} \right)^2}{\delta^2}}_{\text{Standard sample size for a 2-arm trial}} \cdot (1 - \rho^2) \cdot (2 - r)$$

where

- $\delta = E[Y_2^{(d)} - Y_2^{(d')}] / \sqrt{(\text{Var}(Y_2^{(d)}) + \text{Var}(Y_2^{(d')})) / 2}$
- $\alpha$  is the desired type-I error
- $1 - \beta$  is the desired power
- $\rho = \text{cor}(Y_t, Y_{t'})$  for  $t \neq t'$
- $r = P(R_i = 1)$

## Sample Size for an End-of-Study Comparison

$$N \geq \frac{4 \left( z_{1-\alpha/2} + z_{1-\beta} \right)^2}{\delta^2} \cdot \underbrace{(1 - \rho^2)}_{\text{Deflation for repeated measures}} \cdot (2 - r)$$

where

- $\delta = E[Y_2^{(d)} - Y_2^{(d')}] / \sqrt{(\text{Var}(Y_2^{(d)}) + \text{Var}(Y_2^{(d')})) / 2}$
- $\alpha$  is the desired type-I error
- $1 - \beta$  is the desired power
- $\rho = \text{cor}(Y_t, Y_{t'})$  for  $t \neq t'$
- $r = P(R_i = 1)$

## Sample Size for an End-of-Study Comparison

$$N \geq \frac{4 \left( z_{1-\alpha/2} + z_{1-\beta} \right)^2}{\delta^2} \cdot (1 - \rho^2) \cdot \underbrace{(2 - r)}$$

Inflation for SMART design

where

- $\delta = E[Y_2^{(d)} - Y_2^{(d')}] / \sqrt{(\text{Var}(Y_2^{(d)}) + \text{Var}(Y_2^{(d')})) / 2}$
- $\alpha$  is the desired type-I error
- $1 - \beta$  is the desired power
- $\rho = \text{cor}(Y_t, Y_{t'})$  for  $t \neq t'$
- $r = P(R_i = 1)$

## Sample Size for an End-of-Study Comparison

**Table 1:** Example sample sizes for comparison of two embedded DTRs.  $r = 0.4$ ,  $\alpha = 0.05$  (two-sided), and  $1 - \beta = 0.8$ .

Std. Effect Size	Within-Person Correlation		
	$\rho = 0$	$\rho = 0.3$	$\rho = 0.6$
$\delta = 0.3$	559	508	358
$\delta = 0.5$	201	183	129
$\delta = 0.8$	79	72	51

## Working Assumptions for Sample Size

### 1. *Constrained conditional variances.*

$$1.1 \text{ Var} \left( Y_t^{(d)} \mid R^{(a_1)} = 0 \right), \text{Var} \left( Y_t^{(d)} \mid R^{(a_1)} = 1 \right) \leq \text{Var} \left( Y_t^{(d)} \right)$$

$$1.2 \text{ Cov} \left( Y_t^{(d)}, Y_2^{(d)} \mid R = 1 \right) \leq \text{Cov} \left( Y_t^{(d)}, Y_2^{(d)} \mid R = 0 \right) \text{ for all } d \text{ and } t = 0, 1.$$

### 2. *Exchangeable correlation structure.*

$$\text{Var} \left( \mathbf{Y}^{(d)} \right) = \sigma^2 \begin{bmatrix} 1 & \rho & \rho \\ \rho & 1 & \rho \\ \rho & \rho & 1 \end{bmatrix}$$

for all  $d$ .

# Simulation Results

**Target:**  $1 - \beta = 0.8$ ,  $\alpha = 0.05$  (two-sided)

$\delta$	$P(R = 1)$	$\rho$	$N$	Empirical power		
				All satisfied	1.1 violated	1.2 violated
0.3	0.4	0	559	0.799	<b>0.776</b>	–
		0.3	508	0.804	<b>0.767</b>	<b>0.787</b>
		0.6	358	<b>0.825</b>	<b>0.777</b>	0.798
		0.8	201	<b>0.826</b>	<b>0.770</b>	<b>0.819</b>
	0.6	0	489	0.795	<b>0.751</b>	–
		0.3	445	0.797	<b>0.755</b>	<b>0.775</b>
		0.6	313	<b>0.812</b>	<b>0.753</b>	<b>0.779</b>
		0.8	176	<b>0.827</b>	<b>0.724</b>	0.807

**Bolded** results are significantly different from 0.8 at the 0.05 significance level.
